

AI-Enabled Mobile X-ray System for Modern Healthcare – DRGEM RAYMO

1. Introduction to AI Mobile X-ray System

An AI Mobile X-ray System is designed to provide fast, accurate, and portable X-ray imaging at the patient's location, while using AI to improve image quality and support the medical imaging workflow.

1.1 Introduction

An AI Mobile X-ray System is a portable digital radiography device that allows healthcare professionals to capture X-ray images directly at the patient's bedside. Unlike traditional X-ray machines that require patients to be transported to the radiology department, mobile X-ray systems can be moved easily to emergency rooms, intensive care units (ICUs), operating rooms, isolation wards, and ambulances.

Artificial Intelligence (AI) has transformed modern mobile X-ray systems by improving image quality, reducing examination time, assisting radiologists in detecting abnormalities, and minimizing radiation exposure. These intelligent systems are particularly valuable for critically ill patients who cannot be moved safely.

The DRGEM RAYMO is one of the latest AI-enabled mobile digital radiography systems. It combines compact hardware, wireless operation, intelligent positioning assistance, RFID-based user personalization, and AI-supported workflow features to improve efficiency and patient safety. It was recently showcased at India Health 2026 and has received regulatory approvals for global markets. ([DRGEM](#))
